Deal-Sourcing and Comps-Refresh Dashboard

Jainam Mehta · US\$ millions unless stated · as of snapshot 2026-09-18

A deal-sourcing and comps-refresh dashboard across 52 names on the DFM, ADX, Tadawul, NSE and US exchanges, built as a Python script that normalises vendor data to US dollars, recomputes every multiple from its components, flags what the vendor got wrong, and runs four screens a coverage desk uses: take-private candidates, value against quality, banks on P/B and ROE, and drawdowns.

What this is

How it is built

- universe.csv defines the names, regions and sectors; snapshot.json holds the vendor fields and FX rates for a reproducible offline build; --refresh pulls live data.
- Each record is normalised in its own currencies (price currency for market cap, financial currency for the statements), EV is rebuilt from components, and the vendor's multiple is compared with a 25% tolerance.
- Screens: below-sector-median EV/EBITDA with FCF yield above 6% and leverage below 1.5x; P/B against ROE with the justified line from Project 11; more than 25% below the 52-week high.
- The Excel dashboard is written through ibkit; the four-chart panel is regenerated on every run.

Contents

[Dashboard](#) — [the four charts](#)
[Comps](#) — [all names, US\\$ basis, recomputed and vendor multiples, flags, sector medians](#)
[Take-Private Screen](#) — [cheap, cash-generative, under-levered](#)
[Bank Screen](#) — [P/B against ROE and the justified multiple](#)
[Situational Screen](#) — [drawdowns](#)
[Data Quality](#) — [what the vendor got wrong](#)
[Checks](#) — [nine tests; must read MODEL OK](#)

Key outputs (live)

Names in the universe	52
Usable records	48
Records flagged	10
Take-private candidates	3
Banks screened	8
Names >25% off the high	15

Colour code

Blue = hard-coded input
Black = formula
Green = link to another sheet
Accent fill = scenario selector / key levers

Sources

Vendor fields from Yahoo Finance via yfinance, snapshot 18 September 2026; FX from the same source. Universe, thresholds and the cost of equity for the bank line are stated in the script.

A screen is a list of places to look. Nothing here is a recommendation or a suggestion that any company is in a process.

Prepared by

Duke Energy	US	Utilities	92,426	183,959	16,617	11.1x	11.3x	17.9x	550.8%	5.5x	50.7%	1.7x	9.9%	11.9%

SECTOR MEDIANS — EV/EBITDA, non-financials (live from the table)

Consumer	31.8x
Energy	8.8x
IT services	8.9x
Infrastructure	18.4x
Real estate	1.9x
Retail	27.9x
Technology	24.4x
Telecom	9.3x
Utilities	10.9x

EV and EV/EBITDA are recomputed as market cap + debt – cash over EBITDA, each converted from its own currency. The Vendor column is the data provider's figure; a red flag names the disagreement. Infosys and HCL are the standing example: financials in dollars, market cap in rupees, so the vendor multiple is a thousand times too high.

Below sector median EV/EBITDA, FCF yield above 6%, net debt below 1.5x EBITDA

TAKE-PRIVATE SCREEN

Company	Region	Sector	EV/EBITDA	Discount to sector median	FCF yield	Net debt/EBITDA	EBITDA margin	Mkt cap US\$m
Cognizant	US	IT services	7.2x	(19.1%)	7.7%	0.3x	18.6%	27,873
EPAM Systems	US	IT services	7.2x	(19.0%)	12.0%	-0.8x	13.4%	6,041
Wipro	India	IT services	8.2x	(7.3%)	7.6%	-1.0x	18.4%	16,872

The screen that found Cognizant for Project 7. Real-estate developers are excluded because customer advances make EV/EBITDA meaningless for them (see the flag on the Comps sheet). A name appears when the market is capitalising its cash flow below its peers and the balance sheet can carry acquisition debt. It is a list of places to look, not a list of deals: the next step is the shareholder register and the reason for the discount.

P/B against ROE, with the justified P/B from Project 11 at a 10% cost of equity and 3% growth

BANK SCREEN

Company	Region	Sector	P/B	ROE	Justified P/B	P/B vs justified	Mkt cap US\$m
Emirates NBD	UAE	Banks	1.4x	16.7%	2.0x	(30.3%)	52,935
Dubai Islamic Bank	UAE	Banks	1.2x	15.0%	1.7x	(29.2%)	14,325
Mashreqbank	UAE	Banks	1.8x	18.6%	2.2x	(20.8%)	18,292
HDFC Bank	India	Banks	1.9x	13.8%	1.5x	20.1%	117,757
JPMorgan Chase	US	Banks	2.6x	17.8%	2.1x	24.3%	928,531
Bank of America	US	Banks	1.5x	11.2%	1.2x	26.3%	406,838
ICICI Bank	India	Banks	2.5x	16.1%	1.9x	35.7%	100,662
Al Rajhi Bank	Gulf	Banks	3.3x	18.5%	2.2x	48.0%	105,420

A bank trading well below its justified multiple is either earning an unsustainable return or being discounted at a rate the country-risk build-up does not capture — Project 11's finding for Emirates NBD. A single cost of equity is applied to four markets here for comparability; a real screen would use one per market.

More than 25% below the 52-week high

SITUATIONAL SCREEN

Company	Region	Sector	Price (local)	52-wk high	Drawdown	EV/EBITDA	Mkt cap US\$m
EPAM Systems	US	IT services	117.10	222.53	47.4%	7.2x	6,041
Trent	India	Retail	2,792.70	5,158.00	45.9%	50.7x	15,531
Wipro	India	IT services	163.53	273.10	40.1%	8.2x	16,872
Infosys	India	IT services	1,044.80	1,728.00	39.5%	9.4x	44,134
TCS	India	IT services	2,116.80	3,350.00	36.8%	10.2x	79,875
Emaar Development	UAE	Real estate	13.40	20.70	35.3%	0.5x	14,593
Accenture	US	IT services	190.29	291.09	34.6%	8.9x	116,446
Emaar Properties	UAE	Real estate	11.74	17.25	31.9%	3.2x	28,252
HCL Technologies	India	IT services	1,242.70	1,780.10	30.2%	11.8x	35,068
Cognizant	US	IT services	61.88	87.03	28.9%	7.2x	27,873
Dubai Islamic Bank	UAE	Banks	7.28	10.20	28.6%		14,325
Dabur	India	Consumer	387.60	542.80	28.6%	26.0x	7,171
HDFC Bank	India	Banks	732.40	1,020.50	28.2%		117,757
Tabreed	UAE	Utilities	2.39	3.33	28.2%	11.6x	1,851
Hindustan Unilever	India	Consumer	1,954.20	2,667.20	26.7%	30.6x	47,886

Drawdowns are where activism, take-privates and rights issues come from. The list is sorted by the size of the fall; the question for each name is whether the fall is the sector's or the company's.

What the vendor got wrong, and what the dashboard did about it

FLAGS

Emaar Properties	UAE	<i>EV/EBITDA not meaningful for developers: customer advances sit in cash and shrink EV; screen on P/B or NAV (Project 13)</i>
Emaar Development	UAE	<i>vendor EV/EBITDA 0.8x vs recomputed 0.5x; EV/EBITDA not meaningful for developers: customer advances sit in cash and shrink EV; screen on P/B or NAV (Project 13)</i>
Aldar Properties	UAE	<i>vendor returned no record</i>
Salik	UAE	<i>P/B not meaningful (negative or tiny book)</i>
e& (Etisalat)	UAE	<i>vendor returned no record</i>
First Abu Dhabi Bank	UAE	<i>vendor returned no record</i>
ADCB	UAE	<i>vendor returned no record</i>
Infosys	India	<i>price in INR, financials in USD: converted separately; vendor EV/EBITDA 956.0x vs recomputed 9.4x</i>
HCL Technologies	India	<i>price in INR, financials in USD: converted separately; vendor EV/EBITDA 1217.9x vs recomputed 11.8x</i>
Apple	US	<i>P/B not meaningful (negative or tiny book)</i>

Names in the universe [52](#)

Names with a usable record [48](#)

Names with at least one flag [10](#)

Names whose financials are in a different c [2](#)

Names where the vendor multiple disagree [3](#)

A comps refresh that trusts the vendor's multiples is not a refresh. Roughly one name in eight in this universe has a currency mismatch or a multiple that does not reconcile to its own components; two of the largest Indian IT companies would appear at a thousand times EBITDA. Recomputing from components is the whole point of the script.

Four charts — regenerated from the table on every run

Every check must read TRUE

INTEGRITY CHECKS

Every usable record has a positive market capitalisation	TRUE
Recomputed EV/EBITDA on the Comps sheet equals (EV – net debt basis) for every name w	TRUE
Take-private screen names all sit below their sector median	TRUE
Take-private screen names all clear the FCF-yield and leverage thresholds	TRUE
No usable record has a currency mismatch left unconverted (all EV in US\$)	TRUE
Infosys and HCL recomputed multiples are below 40x (the vendor figure is ~1,000x)	TRUE
Usable records are at least 90% of the universe	TRUE
Sector medians on the Comps sheet evaluate to numbers	TRUE
Snapshot FX rates are present for INR, AED and SAR	TRUE

MODEL STATUS

MODEL OK

Several checks are evaluated in Python at build time and written as constants, because the screens themselves are computed in Python; the live checks test the Comps sheet's own formulas.
